## Damage Prevention Software

Trusted. Supported. Innovative.

KorWeb — MAP-BASED ROUTING

This is the ultimate tool to efficiently route and dispatch your tickets. It surpasses the traditional method of data-routed tickets with its additional capability of organizing tickets geographically. Map-based routing gives users the ability to draw their own polygons on a map to designate zones where each locator works. This provides an alternative routing option that leverages a visual approach to their workload. Reporting and analytics are available for individual zones and multiple zones.

Draw separate zones and run reporting on each, like number of tickets, ticket type, and marked vs cleared

Zone Identification

Draw polygons to establish zones across a specific geographic area, generate statistics for each zone, and set up automatic ticket routing accordingly.

Benefits

- Improve efficiency by automatically routing tickets to the best mobile in the field
